Signed, Sealed, Delivered: Digital Receipts in the Ugandan Dairy Chain (Job Market Paper)

with David J. Henning

We provide causal evidence that digital receipts—SMS messages reporting milk deliveries—can improve accountability, delivery behavior, and product quality in agricultural markets with limited monitoring and weak enforcement mechanisms. In a randomized experiment with dairy cooperatives in western Uganda, the intervention improved milk quality: treated farmers delivered higher quality (less diluted) milk. Additionally, among farmers who rely on transporters, digital receipts increased the likelihood of detecting discrepancies, switching baseline transporters, and reporting lower trust in intermediaries. Furthermore, treated farmers, particularly those who self-deliver, were significantly more likely to deliver milk. This increase in delivery occurred without a change in average volumes delivered, suggesting a shift along the extensive margin. These results show that the intervention works differently depending on whether information frictions are present: for self-deliverers, who already have full observability over their deliveries, impacts are concentrated on supply frequency, while for transporter users, where observability is limited, impacts are concentrated on detecting discrepancies and moving away from dishonest transporters. By turning unobservable transactions into verifiable digital records, SMS receipts enhance transparency and make intermediary behavior more observable. Overall, our findings show how simple digital tools can reduce information frictions, but that their effects depend on the intensity of those frictions.
