**Signed, Sealed, Delivered: Digital Receipts in the Ugandan Dairy Chain (Job Market Paper)**

*with David J. Henning*

We provide causal evidence that digital receipts—SMS messages reporting milk deliveries—can improve accountability, delivery behavior, and product quality in agricultural markets. In a randomized experiment with dairy cooperatives in western Uganda, we find that treated farmers—particularly those who self-deliver—are significantly more likely to deliver milk. This increase in delivery activity occurs without a change in average volumes delivered, suggesting a shift along the extensive margin. The intervention also improves milk quality: treated farmers deliver higher-quality (less diluted) milk, as measured by lactometer readings. Among farmers who rely on transporters, digital receipts increase the likelihood of detecting discrepancies, switching baseline transporters, and reporting lower trust in intermediaries. By turning unobservable transactions into verifiable digital records, SMS receipts enhance transparency and make intermediary behavior more observable. These findings show how simple digital tools can reduce information frictions, shift farmer and intermediary behavior, and improve product quality in fragmented agricultural systems.

**Banking Amidst Conflict: How Violence Shapes Financial Inclusion in Mexico**

*with Xiaofei Wang*

We investigate how conflict influences the use of formal financial services in Mexico. Using police reports and death records from the Ministry of Health, we construct municipality-level forecasts of expected violence from 2011 to 2020. Deviations from these forecasts—months with unexpectedly high violence—serve as proxies for unanticipated public safety shocks. We then study how these localized, time-specific episodes affect individuals' use of financial services, distinguishing between traditional banking channels and non-traditional outlets. Our analysis leverages administrative transaction data from the National Banking and Securities Commission, covering all municipalities in Mexico over the same period. We also examine whether security concerns accelerate the adoption of digital financial tools as a risk mitigation strategy. By focusing on behavioral responses to violence—rather than long-run correlations—we shed light on the indirect transaction costs of insecurity and the adaptive strategies households use to navigate fragile environments. This research contributes to the growing literature on financial inclusion in conflict-affected settings and offers insights for designing more resilient financial systems in the face of localized violence.
